rubisec

A Converged Security Platform

Our solutions

Retail

Loss prevention and shrinkage are top priority for retailers. Rubisec makes it possible to manage large amounts of data and identify suspicious activity and fraud in a timely manner. Our platform delivers customizable features that can integrate and unify retail tools, such as: CCTV, POS and EBR (Enhanced Business Reporting) systems to deliver retailers all business intelligence they need to prevent theft, fraud and loss.

- Monitor all locations and systems on one platform
- Brand independent approach
- Access Real-time footage from alerts
- Easily identify suspicious activity and exception-based transactions
- Remotely access and monitor all activity across multiple locations in real time

Critical Infrastructure

Energy and Utilities fall under the critical infrastructure category where threat levels and incidents need to be carefully managed and evaluated. Identifying disruptions in operations, damaged infrastructures or equipment, threats or incidents resulting in losses are critical. Our platform delivers critical infrastructure entities an intelligent PSIM solution, which converges and unites all disparate physical security systems to provide a centrally managed command and control station.

Perimeter intrusion detection systems, Intercom and ACS systems, CCTV systems, UVIS and ANPR systems, Radars, RF and Barcode systems and more can be integrated on the same platform to control all facility information.

Banks &
Financial Institutions

Banks and financial institutions have many challenges nowadays: Regulations, management of various and distributed systems, multiple branches, ATM's, operational centers, user synchronization...

Our platform provides the seamless integration between facilities' security systems and a central management platform. Securely monitor all security system data and reporting, Integrate and standardize physical security systems while Identifying information that allows users to swiftly respond to incidents and threats.

Educational Institutions

With the ever-changing requirements for schools and campuses, in addition to the rise in school threats every year, campus security has never been more important. However, legacy systems, disparate security systems and other technological gaps, within campus physical security and communications systems, make it difficult to bring together a comprehensive, converged system for what campus security should be.

After all, protecting students, staff and buildings, while managing student, visitor and personnel flow is top priority to ensuring a safe, fun and engaged learning environment. Our platform keeps the data flowing in all locations including dorms, stadiums and parking lots in sync while protecting students and teachers, and keeping unwanted visitors at bay.

Safe City

Cities are increasingly vulnerable to criminal activity as physical threats increase and become more advanced. A modern, centralized physical security monitoring system is essential to prevent attacks that could happen without warning. Keep your city safe from physical and cyber threats by securing your critical infrastructure and through the integrated monitoring of CCTV systems including bodyworn cameras, IoT sensors, and many other security systems.

Simplify electronic security and data collection processes in the field with flexible solutions. Streamline the process of collecting, storing and retrieving critical information.

Air Ports

Security in airports requires flexible solutions which fulfill stringent quality and security demands: Distributed cameras, recording and transmission of video signals, live presentation, use of digital networks, intelligent picture processing, integration of audio channels and control as a video system via a higher-order (often already existing) building-management system. Our platform provides airports with a comprehensive, physical security information management solution that integrates and converges all disparate physical security systems and devices into one centrally managed platform, delivering a higher level of visibility, accountability and security for all areas within and around including baggage claim areas, customs, parking lots.

Correctional Facilities

Prisons, correctional facilities or asylums can be some of the toughest institutions to regulate security for. They not only have to think about traditional security measures but also security features that address concerns including: inmate escapes, gang control, riots, overcrowding, potential hostage situations and contraband.

Many of these issues are high risk, and can often turn volatile at a moments notice, especially when paired with those institutions that may be short staffed, or in need of technology that will seamlessly tie all their systems together for better control. Our platform provides customized solutions for such concerns, providing a central monitoring and management of access control systems, intercom, perimeter intrusion and CCTV systems.

Marine Ports

Ports are one of the most critical entry points to global economies and transport, and face some of the most difficult security challenges amongst all industries. Our platform solidifies security infrastructures with its converged systems platform that integrates all disparate physical security systems into one main dashboard, providing port security personnel with 360° visibility, control and intelligence gathering across all port areas. Radar and sonar systems, gate access control, CCTV & Underwater cameras, perimeter and intrusion sensors, automated targeting systems, aerial surveillance devices can all be integrated into our platform and monitored in the same dashboard.
